Travelling abroad with Apomorphine hydrochloride (Dacepton) and the D-mine delivery system (injection pen and infusion pump)

TO WHOM IT MAY CONCERN

Apomorphine hydrochloride (Dacepton)

Apomorphine hydrochloride is used for the treatment of Parkinson's disease. Apomorphine hydrochloride possesses **NO** narcotic properties and is **NOT** a controlled drug in any country. The D-mine pen and D-mine pump system is used for delivering this medication. The D-mine pump is a small battery-operated infusion pump which doesn't emit radio waves and therefore will not interfere with electronic devices.

Apomorphine hydrochloride is a treatment prescribed by a medical practitioner and is used in accordance with his or her directions. Consequently, it is necessary for patients to carry supplies of apomorphine hydrochloride in the form of Dacepton cartridges and needles used in conjunction with the D-mine pen and/or Dacepton vials and reservoirs used in conjunction with the D-mine pump. All medication and equipment should remain with the patient at all times and should be kept at room temperature **ONLY**.

Your co-operation in this regard is appreciated.

Kind Regards
